

Sprinkler Installation Parts from

Hunter®

Hunter® Irrigation is a recognized leader in the manufacturing of irrigation products and we are proud to use their products on every one of our installations. With their proven track record of performance and reliability coupled with our attention to detail we are pleased to provide you with a *5 year warranty* on our new installations.

The Hunter® Irrigation parts shown below are typical parts we use on all of our installations. For further information on any of these components click on any of the pictures below to be taken directly to the Hunter® product page.

Controllers

Hunter® controllers are among the most reliable and user friendly available today. The Pro-C and its cousin PCC are light commercial quality controllers that offer many features. The main difference between the two is the Pro-C

starts as a 4 station controller and is expandable up to 16 stations by adding modules while the PCC is a fixed station controller. Either option would be an ideal controller for your yard and come standard on every one of our installations.

The X-Core is a solid residential quality controller that offers almost all of the features of the Pro-C or PCC. It's a fixed station controller available up to 8 stations. If you don't mind giving up a couple of features this controller can be substituted on your system and you will save approximately \$30 - \$50.

Rain Sensors

Mini-Clik®

Rain-Clik™

Solar Sync™

A rain sensor is a small device connected to the controller that prevents your sprinklers from turning on after receiving an adequate amount of rainfall. There are both wired and wireless models available. We typically use a wired rain sensor that connects directly back to the controller. There are several different

options including Solar Sync™ which effectively turns a Hunter® compatible controller (all the controllers we install are compatible) into a *smart* controller adjusting daily for changes in sunlight and temperature. We invite you to compare your different options by *clicking here* for an overview of sensors available from Hunter®.

Valves

The professional grade valves (PGV) from Hunter® are a proven workhorse. The purpose of a valve is to keep water at bay until the controller sends a small electric current through wires underground that actuate the connected electric solenoid. Once activated water is now allowed to flow through the valve downstream to the connected sprinklers. This is how we are able to separate different sets of sprinklers into zones (also referred to as stations or sections).

Rotor Sprinklers

Hunter® PGP & PGJ rotors are the gold standard by which all other rotors are measured. With the ability to cover more square footage per zone than traditional spray sprinklers this is the ideal choice for large sized areas. This durable and reliable sprinkler will keep your lawn beautiful for many years to come.

MP Rotator®

Hunter's® MP Rotator® is a water conserving sprinkler ideally suited for medium to medium-large sized areas. This sprinkler has multiple rotating streams and a unique multi-trajectory delivery system which enable it to conserve water. In fact compared to traditional spray sprinklers Hunter's® MP Rotator® can save up to 30% on water usage and runoff.

PRO-SPRAY®

Hunter's® Pro-Spray sprinklers are our top choice for small to medium sized areas. The great amount of features built-in, make this a proven reliable and durable performer. Spray sprinklers deliver water at a rate of 3-4 times faster than other types of sprinklers. The faster delivery rate allows for less time needed to get all the water required for your lawn and flower beds, a key advantage with our frequent water restrictions.

Sprinkler Installation Parts from Rain

Bird®

Rain Bird® irrigation products are among the best in the industry. Although we do prefer to use Hunter® irrigation products for the majority of our installation there are a couple of parts that we give the nod to Rain Bird®. In fact our confidence in these components is so high that like all other parts of our systems we back them with a *5 year warranty*.

The Rain Bird® Irrigation parts shown below are typical parts we use on all of our installations. For further information on any of these components click on any of the pictures below to be taken directly to the Rain Bird® product page.

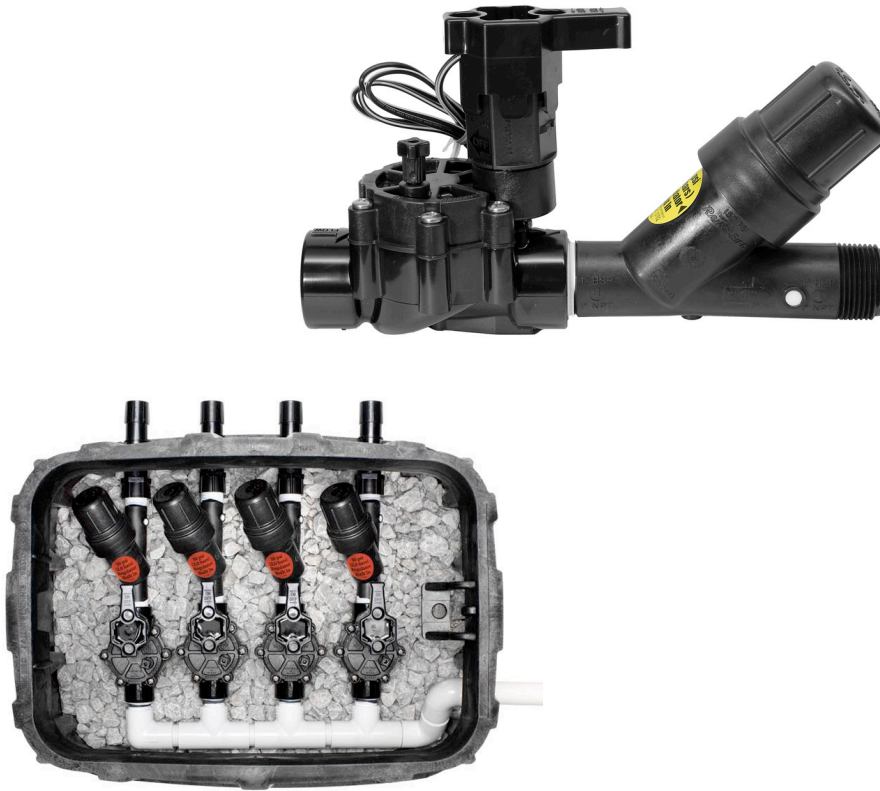

Nozzles

Matched Precipitation Rate spray nozzles by Rain Bird® are our top choice for spray head sprinkler nozzles. Nozzles are the component in a sprinkler system that actually delivers the water to your lawn or flower beds. Rain Bird's® MPR

nozzles have proven to us time and again to consistently deliver uniform water coverage.

Drip Zone Control Kits

Rain Bird's® XCZ drip zone control is the heart of a drip irrigation system. Featuring their DVF valve combined with a filter and pressure regulator this kit ensures filtered water at a reduced water pressure (necessary for proper operation) is available to the *drip tubing*.

Drip Tubing

Rain Bird® XFD & XDS dripline is our first choice for dripline tubing in flower beds. Impressive flexibility and a pressure regulating self rinsing diaphragm built-in to each emitter are some of the features which set this dripline apart from others. This drip tubing can be covered with mulch or rock allowing for a natural look in your flower beds. XFD Dripline from Rain Bird® is sure to have your landscape beds looking beautiful for years to come.
